User Input

Python allows for user input.

That means we are able to ask the user for input.

The method is a bit different in Python 3.6 than Python 2.7.

Python 3.6 uses the `input()` method.

The following example asks for the username, and when you entered the username, it gets printed on the screen:

```python
username = input("Enter username:")
print("Username is: " + username)
```

```
Enter username: Ghofran
```

Output:

```
Username is: Ghofran
```

Python stops executing when it comes to the **input( )** function, and continues when the user has given some input.
